Measuring Method Of Characteristics

9 Capacitance

- 1) Charging is performed by constant current followed by constant voltage charging
- 2) Charging is performed for duration of 30 minutes at rated voltage.
- 3) Discharge use a constant current load device and measure the time for the terminal voltage to drop from V_1 to V_2 upon discharge at 1mA/F. ($V_1 = 0.8 \times V_R$, $V_2 = 0.4 \times V_R$)
- 4) The capacitance can be obtained by the following equation.

$$C = \frac{I \times (T_2 - T_1)}{V_1 - V_2} \text{ (F)}$$

10 ESR

- The AC Resistance is used.
- 1) The Frequency of the measuring voltage shall be 1kHz.
 - 2) The AC current shall be from 1 to 10mA.

installation		
11	Power Cable Connection	<ol style="list-style-type: none"> 1) Confirm cleanness of compression terminal. 2) Connecting a power cable, use standard size nut and spring washer. 3) A screw should be tightened with standard torque according to 'bolt' and 'nut' size. 4) Confirm the polarity of cable for correct connection.
12	Caution	<ol style="list-style-type: none"> 1) In case more than two Green-Cap modules are connected in series, use capacitor module of the same specification supplied by the same company This is to prevent unbalances resulting from difference of capacitance and leakage current of Module. 2) In case more than two Green-Cap modules are connected in Series, each module should be connected together with equivalent voltage(0V) after those modules are discharged completely. 3) If the outside of a Module is wet, Do not touch it. 4) Never touch both capacitor terminals at the same time. 5) Do not open the case of Green-Cap Module. 6) Operate the Green-Cap module under the guaranteed range. 7) Before the module is stored, discharge the module completely, then Short the terminal.
